Abstracts

The wireless electroencephalogram (EEG) system for animals is a device specifically designed to record the electrical activity of animal brains. It collects EEG signals by installing electrodes on the animal's head and transmits these signals wirelessly to a receiving device. This allows for the monitoring and analysis of spontaneous and rhythmic electrical activities within the animal's brain, providing crucial insights for neuroscience research, disease diagnosis and treatment, among other applications. Such devices can be designed in either a non-invasive manner (as a head-worn device) or an implantable manner (as an implantable EEG sensor). It can be applied to small animals such as mice and rats, as well as larger animals such as dogs and cows.

The global Wireless EEG Systems for Animals market size was estimated at USD 87.2 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.60% during the forecast period.
