## Abstracts

Wireless Gigabit (WiGig), technically known as IEEE 802.11ad and later 802.11ay, is a wireless communication protocol operating in the unlicensed 60 GHz frequency band, designed to deliver multi-gigabit-speed data transfer over short distances, typically within a single room. Unlike traditional Wi-Fi operating at 2.4 GHz or 5 GHz, WiGig leverages wider channels and advanced beamforming techniques to achieve theoretical speeds up to 8 Gbps (and even higher with 802.11ay), making it suitable for high-bandwidth applications such as wireless docking, uncompressed video streaming, virtual reality, and rapid large-file transfers. However, its high-frequency signals are highly susceptible to obstruction and attenuation, limiting effective range to approximately 10 meters and requiring clear line-of-sight for optimal performance.

The global Wireless Gigabit (Wigig) market size was estimated at USD 720.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 22.50% during the forecast period.
