Report Overview:

Pick to Light uses light devices mounted at item locations on flow rack, shelving, workstations or other storage media to guide operators to the correct product locations and quantities required to fill an order. Also commonly called pick-by-light or light-directed picking, in the right application Pick to Light systems increase pick rate productivity and order accuracy by reducing the walking and reading associated with paper-based or even other semi-automated picking approaches.

The key to Pick to Light is its simplicity. Operators scan a bar code license plate on a tote or shipping container to launch an order in their zone. Illuminated LEDs direct pickers to the right product location, and display the required unit quantity. After picking all pieces the operator confirms the completed activity, often by pressing a button on the device. They then proceed to the next illuminated location and repeat the process until all the necessary picks in their area are finished.

Pick to light includes indicators, sensors, light curtains, operator/maintenance interface (hmi), gateway, connection components, software and so on. And a pick to light system includes different numbers of hardware and software. So the price and the volume cannot be counted.

The Global Wireless Pick to Light Market Size was estimated at USD 142.12 million in 2023 and is projected to reach USD 230.58 million by 2029, exhibiting a CAGR of 8.40% during the forecast period.
