Abstracts

This report studies the Wireless Power Supply (WPS) for Semiconductor. Wireless Power Supply (WPS) also called non-contact power supply system (HID). Since the development of the world's first monorail-type, non-contact power supply system in 1993, Daifuku's wireless power systems have been employed in a wide range of industrial fields including the automotive, semiconductor, flat panel display (FPD), medical products, food, and food container industries. The noncontact power supply system (HID) can supply power to systems without the need for trolleys or moveable cables. Since it does not generate dust, the system is regularly used to power transportation and storage systems in cleanroom environments such as semiconductor and flat panel display production lines. The HID system is widely used in the automobile, semiconductor, and flat panel display manufacturing industries. In short, what many users want from their facilities is high availability. Specifically, this means that maintenance is unnecessary or minimal, only a short time is needed to change the facility's layout, errors and breakdowns do not occur, and recovery from problems is very quick. We anticipate that our HID system will be used extensively in many industries as important support technology to meet these requirements.
