Report Overview

Wireless temperature and pressure sensor is a sensor that can transmit temperature and pressure data through wireless signals. It can be used in various occasions that require remote monitoring and control, such as heating, gas supply, water supply, fire protection, etc. The working principle of wireless temperature and pressure sensors is to use temperature and pressure sensors to convert environmental parameters into electrical signals, then encode and send the electrical signals to wireless gateways or cloud platforms through wireless modules, and finally view and analyze the data through web pages or mobile terminals. The advantages of wireless temperature and pressure sensors are that they can reduce the cost and complexity of wiring, improve the flexibility and reliability of the sensor, realize real-time data collection and remote configuration, and facilitate user management and maintenance. The disadvantages of wireless temperature and pressure sensors are the need to consider battery life and replacement, as well as wireless signal coverage and interference issues.

The global Wireless Temperature And Pressure Sensor market size was estimated at USD 1250.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
