Abstracts

Wireless tour guide systems are audio transmission devices that enable tour guides to communicate with groups of participants via wireless technology such as radio frequency (RF) or infrared (IR), allowing visitors to hear clear, synchronized commentary through individual receivers and headphones without the guide needing to raise their voice, which is particularly valuable in noisy environments, large spaces, or settings requiring multilingual support. These systems typically consist of a transmitter with a microphone used by the guide and portable receivers with earphones for the audience, offering features like multiple channel options to prevent interference among groups, range capabilities that can extend up to several hundred meters depending on the technology, and often include accessories such as lanyards, charging cases, and optional recording functionalities to enhance usability and convenience for both cultural sites and corporate or educational tours.

The global Wireless Tour Guide Systems market size was estimated at USD 135.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.15% during the forecast period.
