Abstracts

Wood Based Biochar refers to using wood or woody biomass as raw material and converting it into charcoal material through a pyrolysis process. Pyrolysis is a heating process carried out in an oxygen-free or low-oxygen environment. By controlling the temperature and atmosphere, the organic matter in the wood is converted into a stable carbonaceous product, namely biochar. Wood based biochar is widely used in agriculture and horticulture for soil improvement. It can increase soil water retention, improve aeration and improve soil fertility, helping plant growth and yield improvement. Wood based biochar has carbon-loading capabilities, meaning it permanently stores carbon in the soil, helping to mitigate climate change. It can absorb and fix large amounts of carbon dioxide as a means of carbon neutrality or carbon emissions offset. In addition, wood based biochar also has applications in wastewater treatment. It can absorb organic matter and heavy metals, purify sewage and improve water quality.

The global Wood Based Biochar market size was estimated at USD 340.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.90% during the forecast period.
