Abstracts

Worm Gear Operated Butterfly Valve is a type of butterfly valve operated via a worm gear mechanism, widely used in industrial pipeline systems for regulating and isolating the flow of media. Its core structure includes a disc (butterfly plate) as the closing element and a rotating shaft. The worm gear mechanism, controlled either manually or electrically, drives the disc to rotate within the valve body, enabling opening, closing, and flow regulation. Worm gear operation offers smooth handling and stable torque output, making it suitable for large-diameter and high-pressure applications. It also provides multi-angle control and excellent sealing performance. This valve is commonly used for pipelines transporting water, gas, oil, and other corrosive or non-corrosive media, featuring a compact structure, ease of maintenance, and cost-effective durability.

The global Worm Gear Operated Butterfly Valve market size was estimated at USD 100.78 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 2.90% during the forecast period.
