## Abstracts

Wound viability assessment refers to the comprehensive evaluation of a wound bed's condition to determine its potential for healing, typically involving the analysis of tissue types (such as viable granulation, non-viable slough, or necrotic eschar), perfusion status, presence of infection, and other biological markers that indicate the wound's responsiveness to treatment. This assessment is critical for guiding clinical decisions, including debridement strategies, selection of advanced wound care products, and the implementation of adjunctive therapies, as it helps clinicians differentiate between wounds that are progressing toward healing and those that are stalled or deteriorating, thereby optimizing resource allocation and improving patient outcomes.
