## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on X-Ray Anti-Scatter Grids competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. X-ray anti-scatter grids are specialized devices used in radiographic imaging to improve image clarity by reducing the amount of scattered radiation that reaches the detector. Made of alternating strips of a radiopaque material (like lead) and radiolucent material (such as aluminum or carbon fiber), these grids allow primary X-rays to pass through while absorbing scattered rays that degrade image quality. Commonly used in diagnostic radiology, especially in chest, abdominal, and orthopedic imaging, anti-scatter grids enhance contrast and detail, leading to more accurate diagnoses while minimizing the need for repeat exposures.

The global X-Ray Anti-Scatter Grids market size was estimated at USD 105.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.70% during the forecast period.
