Abstracts

A CsI scintillator is a specialized crystalline material, typically made of cesium iodide, that is engineered to convert incoming X-ray photons into visible light photons with high efficiency and minimal afterglow; this conversion process is critical in digital X-ray imaging systems, as it allows for the capture of high-resolution images with lower radiation doses, making it a fundamental component in medical diagnostics (such as radiography and fluoroscopy), non-destructive testing in industrial settings, and security screening applications, where its performance characteristics—including light yield, decay time, and spatial resolution—directly influence image quality and detection capabilities.

The global X Ray Csi Scintillator market size was estimated at USD 310.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.25% during the forecast period.
