Abstracts

X-ray diffraction measurement service is a professional technical service for material crystal structure analysis based on the principle of interaction between X-rays and crystal materials, providing customers in multiple fields such as materials science, chemistry and chemical engineering, geology and minerals, and biomedicine. This service uses a high-precision X-ray diffractometer to emit X-rays of a specific wavelength to irradiate the surface of the sample to be tested. When the X-rays are elastically scattered by the atoms or ions in the sample crystal, the scattering waves of each atom interfere due to the periodic arrangement of the lattice, forming a diffraction peak in a specific direction. The service provider uses a professional detector to record the diffraction spectrum (including key information such as the position, intensity, and half-height width of the diffraction peak), and combines theoretical models such as the Bragg equation ($2d\sin\theta = n\lambda$, where d is the crystal plane spacing, θ is the diffraction angle, n is the diffraction order, and λ is the X-ray wavelength) to analyze the crystal structure parameters of the sample (such as lattice constant, space group, atomic occupancy, etc.), and then determine the phase composition, crystal orientation, microscopic strain, grain size and other structural characteristics of the material, providing key data support for material research and development, quality control and failure analysis.

The global X Ray Diffraction Measurement Service market size was estimated at USD 770.31 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
