## Abstracts

X-ray fluorescence sulfur-calcium-iron analyzer is a desktop analytical instrument specially developed for the cement and building materials industry. It can also be widely used in environmental protection, chemical industry, petroleum, energy and other fields. X-ray fluorescence sulfur-calcium-iron analyzer uses physical measurement methods for detection based on the principle of X-ray fluorescence energy dispersion of element characteristic rays. The instrument will emit X-rays to the sample to be tested. The sulfur, calcium, iron and other elements in the sample will absorb the energy of the X-rays and be excited to release secondary X-rays (i.e., fluorescence radiation). By measuring the characteristic energy and intensity of these released secondary X-rays, the instrument can quantitatively analyze the content of sulfur, calcium and iron elements in the sample to be tested.

The global X-ray Fluorescence Sulfur Calcium Iron Analyzer market size was estimated at USD 55.9 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.60% during the forecast period.
