### Report Overview:

X-ray Fluorescence (XRF) refers X-ray fluorescence spectrometer, it is an x-ray instrument used for routine, relatively non-destructive chemical analyses of rocks, minerals, sediments and fluids. It works on wavelength-dispersive spectroscopic principles that are similar to an electron microprobe (EPMA). However, an XRF cannot generally make analyses at the small spot sizes typical of EPMA work (2-5 microns), so it is typically used for bulk analyses of larger fractions of geological materials. The relative ease and low cost of sample preparation, and the stability and ease of use of x-ray spectrometers make this one of the most widely used methods for analysis of major and trace elements in rocks, minerals, and sediment.

The Global X-ray Fluorescence (XRF) Market Size was estimated at USD 781.20 million in 2023 and is projected to reach USD 1034.97 million by 2029, exhibiting a CAGR of 4.80% during the forecast period.
