Abstracts

X-ray scintillation screens are specialized detectors used in both medical and industrial radiography to convert incident X-ray photons into visible light, thereby enabling the capture of high-resolution images with lower radiation doses compared to traditional direct-exposure methods. These screens consist of a phosphor layer?often made from materials like gadolinium oxysulfide or cesium iodide?that fluoresces upon X-ray interaction, and they are typically paired with digital sensors or photographic films to produce diagnostic or inspection imagery. The technology is valued for its efficiency in enhancing image contrast and detail, making it integral to applications ranging from non-destructive testing in manufacturing to medical diagnostics such as mammography and dental radiography.

The global X Ray Scintillation Screens market size was estimated at USD 325.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
