Abstracts

X-ray therapy equipment, also known as radiotherapy or radiation therapy systems, refers to medical devices designed to deliver precisely targeted high-energy ionizing radiation?primarily in the form of X-rays?to destroy or damage cancer cells and shrink tumors while minimizing exposure to surrounding healthy tissues. These systems include external beam radiotherapy devices like linear accelerators (LINACs), which generate high-energy X-ray beams, as well as specialized modalities such as stereotactic radiosurgery (SRS) and stereotactic body radiotherapy (SBRT) systems that enable highly precise dose delivery. Advanced features often integrated into modern systems include image-guided radiotherapy (IGRT) for real-time targeting, motion management technologies to account for patient or organ movement, and sophisticated treatment planning software to optimize radiation dose distribution. The equipment is used across oncology departments in hospitals, specialized cancer centers, and outpatient clinics to treat a wide range of malignancies, either as a standalone treatment or in combination with surgery, chemotherapy, or immunotherapy.

The global X Ray Therapy Equipment market size was estimated at USD 1250.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.75% during the forecast period.
