Abstracts

X-ray protective aprons are specialized medical garments designed to shield healthcare professionals, patients, and other personnel from harmful ionizing radiation during diagnostic imaging procedures, such as radiography, fluoroscopy, and computed tomography (CT) scans. These aprons are typically constructed using lead or lead-equivalent materials, such as bismuth or tungsten, embedded within flexible layers of vinyl or rubber to ensure both safety and comfort. They function by absorbing or attenuating scattered radiation, thereby minimizing exposure to sensitive organs and tissues, and are available in various designs including full-wrap, front-only, and thyroid collars to provide targeted protection based on the specific procedure and user role. Compliance with international safety standards, such as those set by the International Electrotechnical Commission (IEC) and the American National Standards Institute (ANSI), is critical to ensure efficacy, durability, and consistent performance across different clinical environments.
