Abstracts

The XNOR gate is a basic gate circuit in digital logic circuits. The XNOR gate has two input terminals and one output terminal. Its basic function is to perform the "XOR" logic operation, that is, when the states of the two input signals are the same, the output is high (logic 1); when the states of the two input signals are different, the output is low (logic 0). This logical relationship can also be expressed as: when all input signals are the same, the output is true (high level), and when more than one input signal is different, the output is false (low level).

The global XNOR Gate market size was estimated at USD 224.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
