Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Yaw Brake Disc competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The yaw brake disc is the core braking component in the yaw system of a wind turbine, and its surface is covered with friction materials (such as copper-based powder metallurgy or resin-based composite materials). Its core function is to generate friction through hydraulic or mechanical drive to brake the yaw bearing, ensuring that the wind rotor is accurately aligned with the wind (yaw action) when the wind direction changes or to keep the cabin stable under extreme wind conditions, preventing energy loss or structural overload caused by deviation between the wind rotor's rotating axis and the wind direction. This component must meet high wear resistance, heat resistance and corrosion resistance requirements to adapt to long-term exposure to the outdoors, frequent start-stop and high-load variable load conditions. Its braking performance directly affects the safe operation and power generation efficiency of wind turbines.

The global Yaw Brake Disc market size was estimated at USD 393.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
