Abstracts

The Yellowness Index Meter is a specialized optical instrument used to measure the degree of yellowing in materials such as plastics, textiles, paper, coatings, and other polymers, employing standardized methods (e.g., ASTM E313 or ISO 17223) to quantify color deviation from a pure white or neutral standard under controlled lighting conditions. It operates by directing light onto a sample and analyzing the reflected spectrum, calculating indices like YI (Yellowness Index) or b^* value in the CIELAB color space to objectively assess material degradation, quality consistency, or the effects of aging, UV exposure, or chemical additives. These devices are critical in industries where color stability impacts product performance, aesthetics, or compliance, providing quantitative data for research, manufacturing quality control, and regulatory documentation.

The global Yellowness Index Meter market size was estimated at USD 28.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
