## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Yokeless Axial Flux Electric Motors competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. There are two main types of axial flux motors: yoke axial flux and yokeless axial flux. The yoke axial flux motor is the most common type today, with a relatively simple stator mechanical structure and higher torque density than radial flux motors. However, its power density and efficiency are lower, mainly due to the presence of the double stator yoke, which results in more iron loss and magnetic leakage. The yokeless axial flux motor is completely different. It has no stator yoke, uses concentrated fractional slot windings, and has a permanent magnet rotor on each side of the stator. This design not only reduces material usage, but also significantly improves power density and efficiency. The yokeless design reduces the use of steel in the stator, reduces iron loss, and improves efficiency. At the same time, the straight-through magnetic circuit design makes the magnetic circuit more efficient, further improving the performance of the motor. The use of fractional slot concentrated windings reduces the use of copper, reduces copper losses, and increases current density and torque density. This winding design is easier to automate and reduces manufacturing costs. The torque of the yokeless axial flux motor increases with the square of the radius, which means that the torque output can be significantly increased by increasing the rotor radius. Compared to radial flux motors, yokeless axial flux motors can achieve a volumetric torque density four times higher, while the axial length is three times shorter, making the motor more compact. As the motor mass is reduced, the overall weight is also reduced - a multiplier effect of reduced battery mass and structural mass.

The global Yokeless Axial Flux Electric Motors market size was estimated at USD 512.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.60% during the forecast period.
