Report Overview:

Zeolites are micro porous crystalline solid structures made of aluminum, silicon and oxygen that form a tetragonal framework with cavities wherein cations such as water, sulfur and other small molecules may reside. Zeolites are also known as molecular sieves. Generally, zeolites are of two types: natural zeolites and synthetic zeolites. Around 232 unique zeolite frameworks have been identified and over 40 frameworks of zeolites are known. Synthetic zeolites are predominantly used as detergent builders and absorbents and catalysts. Natural zeolites, on the other hand, find applications in soil amendment, feed additives, water treatment and construction, among others. The core components of detergents are surfactants, builders, bleaching agents, enzymes and special additives, among others. In detergents, zeolites are used as builders to improve the performance of surfactants and other detergent additives by softening the water through the ion exchange process.
