Report Overview

A zero emission building is a building with zero net energy consumption, meaning the total amount of energy used by the building on an annual basis is roughly equal to the amount of renewable energy created on the site, or in other definitions by renewable energy sources elsewhere. These buildings consequently contribute less overall greenhouse gas to the atmosphere than similar non-ZNE buildings. They do at times consume non-renewable energy and produce greenhouse gases, but at other times reduce energy consumption and greenhouse gas production elsewhere by the same amount.

The global Zero Emission Buildings market size was estimated at USD 23270 million in 2023 and is projected to reach USD 152157.29 million by 2032, exhibiting a CAGR of 23.20% during the forecast period.
