## Abstracts

The zero-helium boil-off magnetic resonance imaging (MRI) system is an innovative medical imaging device that uses superconducting magnets to achieve high-resolution imaging while reducing or completely eliminating the consumption of liquid helium. Traditional MRI systems rely on liquid helium to cool superconducting magnets, but liquid helium resources are limited and costly. Zero helium evaporation technology significantly reduces the volatilization of liquid helium through an efficient cooling cycle system or new insulation technology, and even achieves a fully closed cycle of helium. This technology not only reduces operating costs and maintenance complexity, but also improves the environmental protection and safety of the MRI system.

The global Zero Helium Boil-off MRI market size was estimated at USD 4536.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
