Abstracts

A zero-phase reactor is a type of reactor used as a peripheral device of an inverter. The reactor has a structure of coiled electric wire and is installed on the input or output side of the inverter to block high-frequency currents and reduce noise. While a general reactor consists of a single wire wound like a choke coil, a zero-phase reactor consists of three phases of wire wound with equal polarity and number of turns. The zero-phase reactor reduces the noise generated when the inverter is operated. Zero-phase reactors are installed on the input and output sides of inverters to reduce the impact of noise generated by the inverter on peripheral equipment. Inverters are used in a wide variety of fields, including household air conditioners, refrigerators, rice cookers, industrial motors and pumps, elevators, and medical electronic equipment. Zero-phase reactors, which are peripheral devices of inverters, are also widely used.

The global Zero Phase Reactor market size was estimated at USD 334.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.40% during the forecast period.
