Abstracts

Zero-sequence filter is an electronic device used in power systems, mainly used to detect and eliminate zero-sequence current (i.e., residual current generated when the three-phase current is unbalanced). Zero-sequence current is usually caused by ground fault, equipment leakage or three-phase load imbalance, which may cause equipment damage, power waste and even fire risk. Zero-sequence filter improves the safety and stability of power systems by filtering out these harmful currents. It is widely used in industrial equipment, building distribution systems, data centers and renewable energy power generation systems.

The global Zero Sequence Filter market size was estimated at USD 1269.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.00% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global Zero Sequence Filter market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
