Report Overview

Zero Trust Networking Software (ZTNS) is a type of network security and identity management solution that implements the zero trust security model. The zero trust security model is based on the principle of “never trust, always verify”, which means that no users or devices are granted access to the network or its resources without continuous authentication and authorization. ZTNS aims to prevent unauthorized access, data breaches, and insider threats by applying granular policies, segmenting the network, monitoring the traffic and behavior, and adapting the access requirements according to the risk level. ZTNS differs from traditional network security systems, which rely on a perimeter-based approach that assumes that everything inside the network is trusted and everything outside is untrusted.
