Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Zinc Alloy Sacrificial Anode competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A zinc alloy sacrificial anode is a metallic device designed to protect metal structures from corrosion through cathodic protection. It's made from a zinc alloy, which is more electrochemically active than the metal it protects, such as steel. When submerged in an electrolyte (like seawater), the zinc anode corrodes preferentially, "sacrificing" itself to prevent the protected metal from corroding. These anodes are widely used in marine environments, pipelines, and underground structures to extend their lifespan by providing a continuous source of electrons that inhibit the corrosion process. The zinc alloy sacrificial anode industry is tied to upstream zinc mining and alloying processes. Downstream, demand is driven by infrastructure projects, marine industries, and oil and gas sectors. Product specifications are trending towards higher purity alloys and optimized shapes for specific applications, enhancing efficiency and lifespan. The future market is expected to see steady growth, influenced by increasing infrastructure investments globally and stricter corrosion control regulations. The growth of offshore wind farms will also greatly increase demand. Environmental concerns are also pushing for improved recycling and more sustainable production methods.

The global Zinc Alloy Sacrificial Anode market size was estimated at USD 419.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
