## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Zinc-tin Alloy Sputtering Target competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The zinc-tin alloy sputtering target is a high-purity alloy material used in the physical vapor deposition (PVD) process. It is usually made by melting zinc (Zn) and tin (Sn) in a specific ratio (such as Zn:Sn=50:50). It has the characteristics of high density, low impurities and uniform microstructure. The target material is bombarded by ions in a vacuum environment through magnetron sputtering technology, so that the alloy atoms are deposited in the form of a thin film on the surface of the substrate (such as glass, semiconductor or photovoltaic module). It is used to prepare transparent conductive oxide (TCO) films, solar cell electrodes and anti-corrosion coatings. Its advantages lie in its adjustable conductivity and optical properties. It is one of the key materials in the field of display panels and renewable energy.

The global Zinc-tin Alloy Sputtering Target market size was estimated at USD 217.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.10% during the forecast period.
