Abstracts

Zirconium (IV) chloride, commonly referred to as zirconium tetrachloride (ZrCl_4), is a white crystalline inorganic compound primarily used as a precursor in the production of zirconium metal, zirconium dioxide (zirconia), and various organometallic compounds. It is a key intermediate in the synthesis of catalysts, particularly in polymerization processes such as the production of polyethylene and polypropylene, and finds applications in organic synthesis, water treatment chemicals, and the manufacturing of specialty ceramics and coatings due to its ability to act as a Lewis acid. The compound is typically produced through the chlorination of zirconium minerals like zircon sand (ZrSiO_4) or baddeleyite (ZrO_2) at high temperatures, and its market dynamics are heavily influenced by demand from the nuclear industry (for zirconium alloys in cladding materials), the ceramics sector (for advanced refractory materials and pigments), and the growing catalyst market, with supply chains sensitive to the availability of zircon feedstocks and geopolitical factors affecting mineral production regions.

The global Zirconium (Iv) Chloride market size was estimated at USD 25.8 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.25% during the forecast period.
