Report Overview

Tanning is the process of treating skins and hides of animals to produce leather. The tanning process prevents bacterial attack, increases leather's strength, and produces a soft, durable and, flexible material. Chromium, iron, aluminum, titanium, and zirconium are commonly used inorganic tanning agents in the leather industry. Chrome tanning is widely employed because of its high shrinkage temperature property and tensile strength. However, certain limitations of chromium tanning agents have led to the usage of its substitute. Limitations include lack of fiber compaction and high environmental hazards. Furthermore, some countries have imposed stringent limits upon the quantity of chromium emanating from tanneries that is discharged in the environment through liquid and solid wastes.
