Report Overview

A GNSS Disciplined Oscillator (GDO) is a high-precision time and frequency reference device that utilizes Global Navigation Satellite System (GNSS) signals to maintain and synchronize its output frequency. It is designed to provide stable and accurate timekeeping, essential for various applications such as telecommunications, scientific research, and navigation systems. The GDO receives GNSS signals, which are then processed to extract precise timing information. This information is used to discipline the oscillator's output frequency, ensuring it remains synchronized with the GNSS time standard. The disciplined oscillator output is typically a low phase noise signal, suitable for applications requiring high stability and accuracy. GDOs are often used in conjunction with other time synchronization equipment to form a complete time distribution system, ensuring that all devices within a network maintain a common time reference.
