Abstracts

Graded-index fiber is a type of optical fiber in which the refractive index of the core decreases continuously with increasing radial distance from the optical axis of the fiber, as opposed to step-index fiber, which has a uniform refractive index in the core and a lower refractive index in the surrounding cladding. Because the portion of the core near the fiber axis has a higher refractive index than the portion near the cladding, light propagates along a sinusoidal path in the fiber. The most common refractive index profile for graded-index fiber is very close to a parabola. The parabolic profile causes the light to continuously refocus in the core and minimizes modal dispersion.

The global Graded Index Fiber market size was estimated at USD 660.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.70% during the forecast period.
