Report Overview

Graded Index Multimode Fiber (GIMMF) is a type of optical fiber used in telecommunications and data transmission systems. It is characterized by a core with a refractive index that varies with radial distance from the fiber's center. This graded index design allows for multiple light paths or modes to propagate within the fiber, which helps to reduce modal dispersion and improve signal transmission. GIMMFs are typically used for short to medium distance applications due to their lower bandwidth compared to single-mode fibers. They offer advantages such as lower cost, easier installation, and compatibility with a wide range of equipment, making them suitable for various network infrastructures, including local area networks (LANs) and metropolitan area networks (MANs).

In 2024, the global Graded Index Multimode Fiber market is projected to reach approximately USD xx Million, with expectations to grow at a compound annual growth rate (CAGR) of around xx between 2024 and 2033.
