## Abstracts

Grain Management Software is an information-based management system designed specifically for the grain industry. By integrating multiple functions, including procurement, storage, sales, quality control, inventory alerts, and data analysis, it enables refined management of the entire grain supply chain, from planting and purchasing, processing, storage, to sales. The software is designed to help grain companies and related institutions digitize, automate, and intelligentize their business processes, thereby improving management efficiency, reducing operating costs, enhancing quality control, ensuring food security, and boosting market competitiveness. Furthermore, it provides decision-making support, helping companies grasp market trends and make informed decisions. With the escalating global demand for food security, the accelerated digital transformation of agriculture, and the growing demand for refined management by grain companies, the grain management market is experiencing steady expansion, particularly in the integrated applications of emerging technologies such as the Internet of Things, AI, and blockchain, which show strong growth potential. Volatility in the global food supply chain (e.g., extreme weather and geopolitical conflicts) is prompting countries to strengthen food traceability and inventory management. Software is meeting compliance requirements through features such as blockchain traceability and real-time inventory monitoring. Traditional grain companies face challenges such as inefficient manual management and data silos. Software is reducing costs through automated processes (e.g., automated purchasing and weighing, and remote monitoring of warehouse temperature and humidity). The growth of the grain management software market is not only the result of technological advancements but also an inevitable consequence of the global grain supply chain's transition from extensive management to precision and security. It will play a key role in ensuring food security and improving industry efficiency in the future.

The global Grain Management Software market size was estimated at USD 719.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.30% during the forecast period.
