### Report Overview

Granular Heavy Superphosphate (GHSP) is a phosphate-based fertilizer produced by treating phosphate rock with sulfuric acid, resulting in a product containing 16-22% phosphorus pentoxide (P<sub>2</sub>O<sub>5</sub>), along with calcium and sulfur. Unlike ordinary superphosphate, GHSP is granulated to improve handling, storage, and application efficiency, making it particularly suitable for mechanized farming. It is primarily used to address phosphorus deficiencies in crops, promoting root development, flowering, and fruiting, and is favored in regions with low soil phosphorus availability. The granular form reduces dust, enhances nutrient release control, and improves compatibility with blended fertilizers. Demand is driven by agricultural productivity needs, particularly in staple crops like cereals, oilseeds, and legumes, with key markets in Asia-Pacific, Latin America, and Africa, where soil conditions and farming practices align with its benefits. However, competition from high-analysis fertilizers like DAP and MAP, as well as environmental regulations on phosphate mining, pose challenges to market growth.

This report provides a deep insight into the global Granular Heavy Superphosphate market covering all its essential aspects.
