## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Green Methanol Fuel for Marine competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Green Methanol Fuel for Marine refers to methanol produced through sustainable methods—typically involving the use of renewable energy sources and/or carbon capture technologies to minimize greenhouse gas emissions over its life cycle. Compared to conventional fossil fuels, green methanol helps reduce the environmental impact of the maritime shipping industry. With the International Maritime Organization (IMO) continuously tightening emission standards for ships, the demand for green methanol as a clean fuel is expected to keep rising. Green methanol, produced from renewable sources such as biomass or captured CO<sub>2</sub> and green hydrogen, is emerging as a promising low-carbon alternative fuel for the maritime industry. As global regulations like IMO 2020 and upcoming decarbonization targets push shipping companies toward cleaner energy, green methanol offers benefits such as lower sulfur and NO<sub>x</sub> emissions, ease of storage, and compatibility with modified internal combustion engines or methanol fuel cells. Europe and East Asia (particularly China, Japan, and South Korea) are currently the largest markets, supported by policy incentives and growing green shipping infrastructure.

The global Green Methanol Fuel for Marine market size was estimated at USD 510.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 30.00% during the forecast period.
