### Report Overview

A greenhouse (also called a glasshouse, or, if with sufficient heating, a hothouse) is a structure with walls and roof made chiefly of transparent material, such as glass, in which plants requiring regulated climatic conditions are grown. These structures range in size from small sheds to industrial-sized buildings. A miniature greenhouse is known as a cold frame. The interior of a greenhouse exposed to sunlight becomes significantly warmer than the external temperature, protecting its contents in cold weather. Many commercial glass greenhouses or hothouses are high tech production facilities for vegetables, flowers or fruits. The glass greenhouses are filled with equipment including screening installations, heating, cooling, and lighting, and may be controlled by a computer to optimize conditions for plant growth. Different techniques are then used to manage growing conditions, including air temperature, relative humidity and vapour-pressure deficit, in order to provide the optimum environment for cultivation of a specific crop. The scientific name of bell peppers is *Capsicum annuum*, which are characterized by their smooth, glossy exterior of green, red, yellow, purple, or orange colors. While bell peppers are classically considered a non-starchy vegetable, botanical definition classify them a fruit. Pungent (spicy) peppers share the same genus and species, although bell peppers are not bred for their capsaicin content, which is why some cultivated varieties (cultivars) are called sweet peppers. It is hypothesized that the center of origin for *Capsicum* is Bolivia, whereas non-pungent pepper varieties are said to have originated from Central America and southern Mexico. Today, bell pepper production occurs all over the world; the U.S. ranks 5th in total production. The top producing countries, listed in descending order, are China, Mexico, Turkey, and Indonesia. India is the top producer of pungent peppers.
