### Report Overview

Ground effect craft, also known as wing-in-ground (WIG) vehicles or ekranoplans, are specialized transportation vehicles that operate by flying close to the surface of water or land, utilizing the aerodynamic phenomenon known as ground effect to reduce drag and improve lift efficiency. These hybrid vehicles combine characteristics of both aircraft and marine vessels, capable of traveling at high speeds while consuming less energy than conventional aircraft due to the reduced lift-induced drag when flying within one wingspan of the surface. Ground effect craft are primarily used for military, commercial, and recreational purposes, offering advantages such as high-speed transit over water, reduced operational costs compared to helicopters, and the ability to bypass traditional maritime restrictions. However, their adoption is hindered by regulatory challenges, limited infrastructure, and technical complexities related to stability and control in varying surface conditions. The market for ground effect craft remains niche but holds potential for growth in applications such as coastal surveillance, cargo transport, and passenger services in regions with extensive waterways.
