Report Overview

A groundnut skin removing machine is a piece of agricultural equipment designed to remove the outer skin or hull from peanuts. This machine is used to automate the process of shelling peanuts, which is otherwise a labor-intensive task when done by hand. The machine typically works by feeding raw peanuts into a hopper or inlet, where they are then conveyed through a series of mechanisms that apply pressure or friction to remove the skins. The peanuts emerge from the machine with their shells removed, ready for further processing or consumption. Groundnut skin removing machines come in various sizes and capacities, ranging from small-scale models suitable for home use or small businesses to large industrial machines capable of processing tons of peanuts per hour. The choice of machine depends on the volume of peanuts to be processed and the specific requirements of the operation.
