### Report Overview

H2-receptor antagonists, commonly known as H2 blockers, are a class of medications that inhibit histamine action at the H2 receptors of parietal cells in the stomach, effectively reducing gastric acid production. Primarily used to treat conditions like gastroesophageal reflux disease (GERD), peptic ulcers, and dyspepsia, these drugs—including ranitidine, famotidine, cimetidine, and nizatidine—were once among the most widely prescribed gastrointestinal medications. However, their market dominance has declined with the rise of proton pump inhibitors (PPIs), which offer more potent and prolonged acid suppression. Regulatory concerns, such as the 2020 FDA recall of ranitidine due to potential carcinogenic impurities, further impacted the market. Despite this, H2 blockers remain relevant for short-term or intermittent use, particularly in over-the-counter (OTC) formulations for mild acid-related symptoms. The market is also influenced by generic competition, cost-effectiveness, and consumer preference for non-prescription remedies, with emerging markets showing steady demand due to affordability and accessibility.
