Report Overview

A half waveplate, also known as a $\lambda/2$ waveplate or retarder, is an optical device used to modify the polarization state of light. It is designed to introduce a specific phase difference between two orthogonal polarization components of light, typically achieved by utilizing the birefringent properties of certain materials. The phase difference introduced by a half waveplate is exactly half of the wavelength of the light, which results in a 90-degree phase shift between the two polarization components. This phase shift allows the waveplate to convert linearly polarized light into circularly polarized light or vice versa, depending on the orientation of the waveplate's axes relative to the polarization direction of the incident light. Half waveplates are commonly used in various applications, including optical communication, laser systems, and polarization control in scientific and industrial settings.
