Report Overview

A hand-held sphygmomanometer is a medical device used for measuring blood pressure. It consists of an inflatable cuff, a pressure bulb, and a manometer. The cuff is wrapped around the upper arm, and the pressure bulb is used to inflate the cuff, applying pressure to the artery. The manometer, which can be either an analog gauge or a digital display, measures the pressure exerted by the inflated cuff. As the cuff is deflated, the device detects the Korotkoff sounds, which are the sounds made by the blood flowing through the artery as the cuff pressure is released. These sounds are used to determine the systolic and diastolic blood pressure readings. Hand-held sphygmomanometers are portable and can be used in various settings, including hospitals, clinics, and at home, making them a convenient tool for monitoring blood pressure.
