Report Overview

Handheld phototherapy devices are portable medical tools designed to treat skin conditions such as psoriasis, eczema, vitiligo, and neonatal jaundice by emitting controlled wavelengths of ultraviolet (UV) or blue light to target affected areas. These compact, user-friendly devices allow for at-home or on-the-go treatment, offering convenience and flexibility compared to traditional clinical phototherapy sessions. They typically utilize LED or fluorescent light sources, with adjustable intensity settings to cater to varying severity levels of skin conditions. While blue light devices are primarily used for neonatal jaundice, UV-based models (narrowband UVB or UVA) are more common for chronic dermatological disorders, often incorporating safety features like timers and skin sensors to minimize overexposure risks. The market has seen growing demand due to increasing awareness of non-invasive treatment options, technological advancements improving efficacy and safety, and the rising preference for home healthcare solutions. At the same time, regulatory approvals and clinical validation remain critical factors influencing consumer trust and adoption.
