### Report Overview

A handheld tympanometer is a portable medical device used for measuring the function of the middle ear, specifically the eardrum and the ossicular chain. This device is designed to assess the mobility of the eardrum and the presence of middle ear fluid or pressure, which can be indicative of various ear conditions such as otitis media, Eustachian tube dysfunction, or sensorineural hearing loss. The handheld tympanometer operates by delivering a controlled air pressure to the eardrum and measuring the reflected sound waves, which are then analyzed to determine the compliance and pressure of the middle ear. This information is crucial for audiologists, otolaryngologists, and other healthcare professionals in diagnosing and monitoring ear-related disorders, as well as in the fitting and verification of hearing aids.
