### Report Overview

The handset IR-LED proximity sensor is an optoelectronic component used primarily in smartphones and other mobile devices to detect the presence of nearby objects, typically when the device is held close to the user's face during a call. It consists of an infrared LED emitter and a photodetector, which work together to measure reflected IR light to determine proximity, enabling features like automatic screen dimming to prevent accidental touch inputs and conserve battery life. The sensor enhances user experience by improving device responsiveness and power efficiency. Its adoption has grown alongside the demand for smarter, more intuitive mobile interfaces, with manufacturers integrating it into mid-range and premium handsets. The market is driven by advancements in miniaturization, power efficiency, and the increasing adoption of bezel-less displays, which require precise proximity sensing for optimal functionality. Competition among sensor manufacturers focuses on accuracy, response time, and low power consumption, while cost pressures from smartphone makers influence pricing and innovation in the segment.
