Report Overview

Haptoglobin Reagent is a specialized diagnostic product designed for use in clinical laboratories. It is a biochemical reagent used in the measurement of haptoglobin levels in blood samples. Haptoglobin is a plasma protein that binds to free hemoglobin, preventing it from being excreted in the urine and protecting against iron loss. The reagent is typically employed in immunoturbidimetric assays, where it interacts with the haptoglobin in the sample to form a complex that can be measured for its turbidity. This measurement is then used to determine the concentration of haptoglobin in the sample. Haptoglobin levels can be an indicator of various conditions, including hemolysis, liver disease, and certain inflammatory states. The reagent is manufactured to ensure precision and reliability in testing, and it is an essential component in the diagnostic process for assessing patient health.
