Abstracts

The primary function of a heat transfer fluid (HTF) is to efficiently move thermal energy from one location to another - to either cool or heat a specific system in an application or industrial process. EV batteries need to operate at a temperature range between 15°C and 35°C to achieve optimum performance. Heat generation during charge/discharge cycles becomes so intense that it is proving difficult to maintain batteries within that desired temperature range. The result is a loss of battery capacity and potentially a reduction in battery life due to degradation at high temperatures. Heat-transfer fluids are now assuming a more prominent role in EVs due to their ability to quickly remove heat.

The global Heat Transfer Fluids For Electric Vehicles market size was estimated at USD 850.25 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.45% during the forecast period.
