Report Overview

A pallet, sometimes inaccurately called a skid (a skid has no bottom deck boards), is a flat transport structure that supports goods in a stable fashion while being lifted by a forklift, pallet jack, front loader, work saver, or other jacking device, or a crane. Heat treatment is a method of sterilizing the wood to remove all hazardous materials, thereby making the pallets safer and better suited for shipment. The process involves heating the pallet to a minimum core temperature of 56°C (132.8 °F) for at least 30 minutes.
