Report Overview

Heated windscreens, also known as heated windshields, are automotive glass panels embedded with thin, conductive heating elements—typically made of tungsten or silver wires—that quickly defrost or de-ice the glass by generating heat when an electrical current passes through them. These systems enhance driver visibility and safety in cold climates by preventing ice and fog buildup, reducing reliance on traditional defrosting methods like blower fans or chemical de-icers. Advanced versions may incorporate micro-thin heating filaments or transparent conductive coatings to minimize visual obstruction while ensuring efficient heat distribution. The technology is particularly prevalent in premium and cold-weather-focused vehicle segments, often integrated with advanced driver-assistance systems (ADAS) to maintain sensor functionality in adverse conditions.
